

Data Scrambling as a Service (DSaaS)

Epicerter's Data Scrambling as a Service provides the capability to scramble any data point from your Oracle HCM Cloud solution and load to your Development, Test and Training environments

Your Oracle HCM Cloud system stores a lot of sensitive data about your employees and that data needs to be protected in your non-Production environments. In reality, real data often resides in these environments and the options for protecting it are limited. As a result, access to data is controlled with Production-like security or unrealistic, dummy data is created instead. These imperfect solutions inhibit HR & IT teams from doing their jobs to implement and test new functionality or train new users.

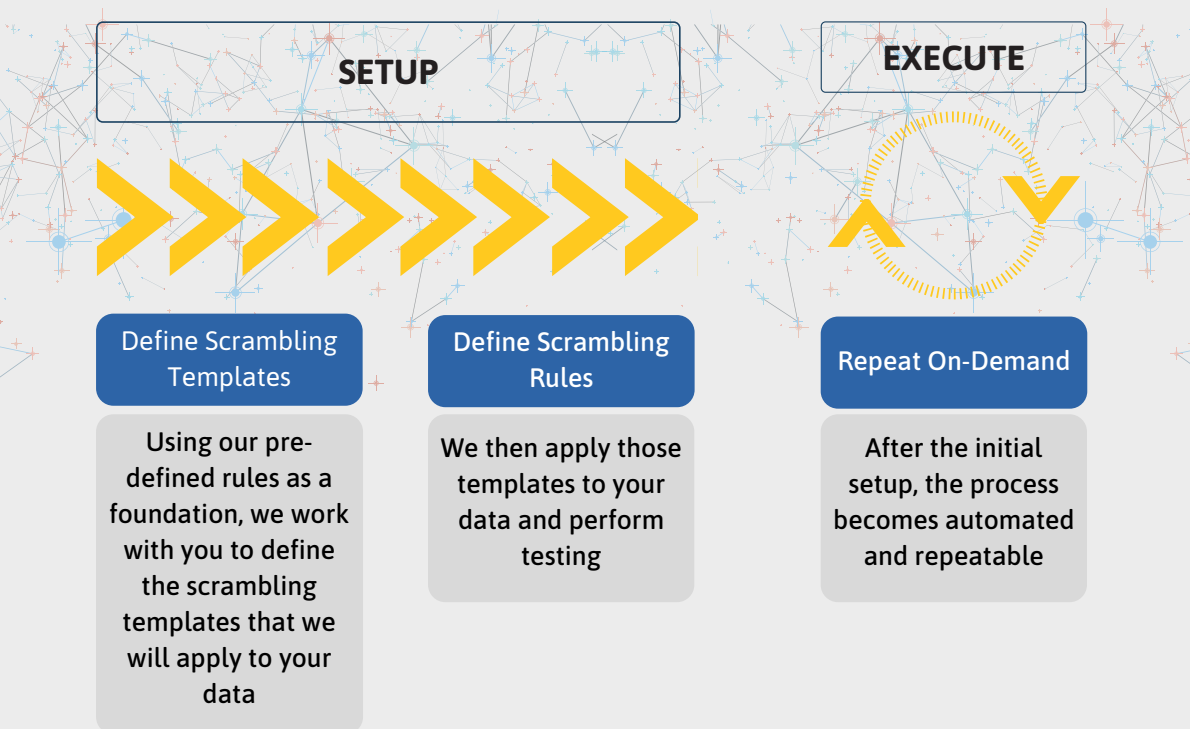

What if you could scramble ANY data point, giving your HR and IT teams access to a full set of realistic, but non-identifiable data?

Epicerter's Data Scrambling as a Service solution seeks to minimise the risks and maximise the value of an HR data set by taking the real data from Oracle HCM Cloud and applying configurable scrambling rules to create a realistic alternative - data that looks real but isn't identifiable. This data can be loaded to one or more non-Production environments where your teams can work freely with no data security risk. What's more, this On-Demand process can be scheduled at any time to suit you.

Benefits of Data Scrambling as a Service

- Scramble any Oracle HCM employee data point (including flex fields)
- Benefit from our library of pre-defined data scrambling templates or define your own
- Scrambled data is realistic
- Process is automated, fast, and repeatable
- On-demand, pay-as-you-scramble service with no licence fee
- 100% secure

How to Setup Data Scrambling as a Service
