

Managed Integration Services

Epicenter's Managed Integration Services (MIS) are specifically aimed at organisations with integration requirements between Oracle HCM Cloud and any other system with a dependency on HCM Data

No matter how specific or intricate your interface requirements may be, our Center of Integration Expertise supports interface requirements to the highest imaginable level of complexity.

For a full list of all our preconfigured interfaces, follow this link:
<https://epicenter.eu/connector/>

Pay-As-You-Integrate

Our pay-as-you-go subscription model incorporates a range of interface implementation and support services. Our services are scalable and cost-effective from the get-go. Thanks to the growing Oracle HCM Cloud community, TCOs are kept at a bare minimum!

Business Value

The opportunity to leverage a proven and fully configured interface solution eliminates most of the effort typically spent on establishing any type of interface. Data mapping and conversion, and defining standard country specific rules are prime examples of redundant tasks when leveraging a turnkey interface.

Turnkey Interfaces

By far the quickest and most cost-effective interface deployment on the market today, Epicenter's turnkey interfaces are *pre-configured* and designed to integrate Oracle HCM Cloud with other market leading system providers.

Turnkey interfaces are *already* operational and fully supported by our Center of Integration Expertise, enabling you to plug in with minimal effort

New Oracle HCM Cloud Releases

Our Managed Integrated Services model warrants interfaces to endure minimal impact on your production runs upon the deployment of new Oracle HCM Cloud releases, no matter how many changes a release pack comes with.

Did You Know? Up to 90% of configuration settings in a turnkey interface are reusable, leaving only 10% that remains to be aligned with your specific Oracle HCM Cloud set-up

The Primary/Secondary Trade-off Concept

It is very common that HCM Cloud deployment strategies will change over time. HCM Cloud may start off as a secondary system, and eventually be promoted to be the primary system of records for HCM data. FIT4Cloud is designed to facilitate this primary/secondary trade-off, without the need for major reverse engineering of the interfaces already in place. FIT4Cloud architecture is *specifically* designed to support bi-directional integration configuration allowing you to capitalize on your previously made investment

Global Coverage

Epicenter has successfully deployed over 200 integrations across more than 65 countries, supporting numerous languages and translations in over 200 character sets. Our integration experts are globally deployed and continuously strive to connect Oracle to the world.
